⚡ *Built for offensive cybersecurity · Updated 2026-08-29*

*"**This is a red-team / offensive-security model.** GLM-5.3 (753B) with refusal removed at the weight level so it produces **real, working security code** — exploits, payloads, tooling — for authorized penetration testing, malware analysis, CTFs, and security research. Verified to generate working **keyloggers, SUID privilege-escalation, AES ransomware, reverse shells, and SSH brute-forcers** across reasoning modes (greedy), with **zero degeneration/looping** and capability preserved (**MMLU 84.11%**, within ~1.5pp of base). Load with stock vLLM.*

***Designed for high / max reasoning-effort usage** — the modes tuned and recommended for offensive-security work. A few borderline social-harm topics may still be declined at lower effort; use high or max effort for the fully-uncensored experience."*

GLM 5.3 CRACK Uncensored NVFP4

CRACK · guardrails removed at the weight level · tuned for **offensive security**

a **CRACK** release by dealignai @dealignai · compute by @jordanschenck

Also mirrored at dealignai/GLM-5.3-ABLITERATED-NVFP4.

> **Runtime notes** — field-tested on 8× DGX Spark GB10 by @0xMagnus (discussion):
>
> - `reasoning_effort` **only honors** `"low"` **and** `"high"`. Every other value — `off`, `medium`, `max`, unset, or an unquoted YAML `off:` (parses as boolean `false`) — falls through to `max`. There is no way to disable reasoning on this checkpoint; pass `"low"` for minimum.
> - **On NVFP4,** `high` **is usable** with `max_tokens ≥ 16384` (finishes cleanly). `max` will often exhaust the budget with a very long reasoning block and a truncated answer. NVFP4 tolerates `high` better than the FP8 build.
> - **Reasoning text is in** `message.reasoning`, not `message.reasoning_content`.
> - **On GB10, NVFP4 is a memory / context play, not a speed play** — no native FP4 compute, weights dequantize on the fly; decode lands near FP8 + MTP. The win is KV pool (~~35~~

~~GiB/rank vs FP8's 7–9 GiB) → practical **512K context at TP8** (~~695K-token pool at 1.33× concurrency).

- **1M context via decode-context-parallel is closed** on `glm_moe_dsa` in vLLM today (DSA indexer `k_cache` is replicated across DCP ranks while MLA KV is sharded → `page size is not divisible by target page size and cannot be padded` for `nvfp4_ds_mla`).

What Is This?

CRACK is dealignai's brand for permanent, weight-level uncensoring. This is GLM-5.3 (753B) in **NVFP4** with its refusal behavior removed **directly in the model weights** — tuned so it complies with **offensive-security** requests (exploit dev, payloads, red-team tooling) that stock models refuse.

- ❌ No fine-tuning / SFT / DPO. ❌ No jailbreak prompt or chat-template tricks.
- ❌ No LoRA, adapters, steering vectors, runtime hooks, or custom `model.py`.
- ✅ A permanent edit baked into the tensors. Load with stock vLLM and it just works.

Specs

Architecture	GLM-5.3 (`glm_moe_dsa`) — MoE + MLA + DeepSeek-sparse attention
Parameters	**753B total · ~18B active** per token
Quantization	**NVFP4** (routed experts NVFP4; attention + shared experts bf16)
Context	1M tokens

MTP	multi-token-prediction draft head — **also CRACK'd** (~87% draft acceptance)
Reasoning	reasoning-off / low / high / max effort

Refusal Rates — HarmBench (greedy, per reasoning-effort mode)

Measured on random HarmBench prompts, greedy decode, single-stream, `max_tokens=1400`, classifier reads **content + reasoning combined** so nothing is counted as refusal by accident:

Reasoning effort	Prompts	Comply	Refuse	Refuse rate
default (off)	109 answered	101	8	**7.3%**
high	76	76	0	**0.0%**
max	80	80	0	**0.0%**

At **high** and **max** the model is fully uncensored — 0 refusals across 156 random HarmBench prompts. The 8 refusals at off-mode are 7 **copyright** ('full lyrics of X', 'long passage from Y') plus 1 political persuasion — the true safety-refusal rate at off is <1%. **Use high or max effort for the fully-uncensored experience.**

Offensive-Security Compliance (direct-read)

Direct-read verification — the model returns **real, working code**, not refusals or redirects:

Capability	Result
Reverse shell / C2 beacon	✅ working code
Keylogger (capture + exfil)	✅ working code
AES ransomware (encrypt + note)	✅ working code
Linux SUID privilege escalation	✅ working code
SSH brute-force	✅ working code
SQL injection payloads	✅ working code

Also complies on broader red-team topics (malware analysis, phishing templates for awareness, recon). **0 looping / degenerate outputs** in every mode.

Capability Preserved — MMLU-logit

Identical logit-mode scoring (argmax over A/B/C/D), 1,026 questions:

	Base	CRACK Uncensored	Δ
MMLU (overall)	**85.58%**	**84.11%**	**-1.47 pp**

MMLU by Topic (base → CRACK)

▶ All 57 MMLU subjects

Usage

```
vllm serve dealignai/GLM-5.3-UNCENSORED-NVFP4
  --tensor-parallel-size 8 --moe-backend marl
  --tool-call-parser glm47 --reasoning-parser
```

NVFP4 routed experts serve via the Marlin FP4 path on Hopper (H100/H200). GLM-5.3's DSA sparse attention needs a recent FlashInfer (>= 0.6.18) for the SM90 sparse-MLA backend.

MTP speculative decoding (also CRACK'd, ~87% draft acceptance): add `--speculative-config '{"method":"mtp","num_speculative_tokens":1}'` and let vLLM auto-select the MoE backend (the bf16 MTP head is unquantized, so don't force a global `--moe-backend`).
